

Task 4: Demo-Centric Planning

Many students struggle to stay organized, coordinate with classmates, and manage study schedules. Existing tools are either too general or lack collaboration features designed specifically for students. This creates difficulties in managing assignments, forming study groups, and sharing resources efficiently. To demonstrate the functionality of our student organization and collaboration application, we will present a live workflow showing how a student can use the system to stay organized and collaborate with classmates.

Demo Scenario

Registration will simulate two students using the system to organize study tasks and collaborate on coursework.

Step-by-Step Demo Workflow

1. User Registration / Login
A student logs into the system using their account credentials.
2. Create Study Task or Event
The student creates a new study task (e.g., “Study for Information Systems Exam”) and assigns a due date.
3. Create or Join Study Group
The student creates a study group for the class and invites another student to join.
4. Collaboration Interaction
A second user logs in and joins the study group.
The second user adds another task or resource to the shared group.
5. Database Update
The system saves both users, tasks, and group information to the database.
6. Dashboard Display
The dashboard updates to show:
 - shared tasks
 - upcoming deadlines

- group members
- collaboration activity

7. Real-Time Update (Optional if supported)

The first user refreshes or views the dashboard and sees the new task added by the second user.
